1. Executive Summary

This comprehensive report provides detailed analytics of the blockchain network, including transaction patterns, mining statistics, double-spending attack simulations, and SimBlock P2P network integration analysis. The report is generated automatically from the live blockchain data and includes visual charts for better analysis.

2. Blockchain Overview

Blockchain Statistics

Metric	Value
Total Blocks	2
Total Transactions	2
Pending Transactions	0
Current Difficulty	3
Mining Reward	1.0 coins
Connected Peers	0

Blockchain Growth Chart

3. Transaction Analysis

Recent Transactions:

- Khurram -> Shahzad: 5.0 coins

4. Wallet Balances

Current Wallet Balances

Metric	Value
Khurram	-5.00 coins
Shahzad	1.00 coins
Redhawk	5.00 coins

7. Double-Spending Attack Simulation

Attack Configuration

Metric	Value
Attacker	Redhawk
Private Blocks Mined	1
Attack Amount	5.0 coins
Hash Power	65%
Success Probability	80%

Attack Outcome:

SUCCESS - Attack Successful

Details: Double spending attack successful with improved probability!

Attack Impact:

Attacker 'Redhawk' stole 5.0 coins from victim 'Shahzad'

Project Instructor: Fouzia Jumani
Email: fouziajumani@vu.edu.pk
Virtual University of Pakistan

Project Author: Eng. Muhammad Imtiaz Shaffi
VU ID: BC220200917
Email: bc220200917mis@vu.edu.pk

8. Network Performance Metrics

Performance Metrics

Metric	Value
Blockchain Synchronization	Optimal
Transaction Throughput	0 pending
Network Latency	100ms
Node Connectivity	0 direct peers
Consensus Efficiency	Active
Attack Detection	Enabled

9. Security Analysis

Security Metrics

Metric	Value
Total Attack Simulations	1
Successful Attacks	1
Attack Success Rate	100.0%
Network Resilience	Medium
Double-Spending Risk	Medium

10. Security Recommendations

1. Monitor for unusual transaction patterns regularly
2. Maintain network node diversity for better security
3. Implement additional validation for high-value transactions
4. Regularly update consensus algorithm parameters
5. Conduct periodic security audits and attack simulations
6. Monitor hash power distribution among network participants

Project Instructor: Fouzia Jumani
Email: fouziajumani@vu.edu.pk
Virtual University of Pakistan

Project Author: Eng. Muhammad Imtiaz Shaffi
VU ID: BC220200917
Email: bc220200917mis@vu.edu.pk

Conclusion

The blockchain network successfully defended against double-spending attacks in most scenarios. However, recent simulations show that under certain conditions (high hash power, favorable network conditions), attacks can succeed. Continued monitoring and security enhancements are recommended.

11. Technical Details

System Configuration

Metric	Value
Blockchain Implementation	Custom Python Blockchain
Consensus Algorithm	Proof of Work (PoW)
Mining Difficulty	3
Block Time	Variable (Based on difficulty)
Transaction Format	JSON-based
Hash Algorithm	SHA-256
Network Protocol	REST API + SimBlock P2P
Report Generation	Automated - 2025-10-04 14:59
